THE AMERICAN MINERALOGIST, VOL. 49, JANUARY-FEBRUARY, 1964

X-RAY POWDER DATA FOR AMINOFFITE

J. A. MANDARINO, *Earth Sciences Division, Royal Ontario Museum, University of Toronto, Toronto, Ontario.*

When aminoffite was first described by Hurlbut (1937), single-crystal x -ray data were included, but not powder data. The writer borrowed one of the type specimens (Harvard Museum No. 106917) and removed a few small crystals for a powder pattern. The measured data were indexed

using Hurlbut's single-crystal data: space group $I\ 4/mmm$, $a=13.8$ Å, and $c=9.8$ Å. The results are shown in Table 1. The weak line at $d=2.96$ is probably due to a small amount of magnetite.

The writer is indebted to Professor Hurlbut for providing the aminofite specimen.

REFERENCE

HURLBUT, C. S. (1937) Aminoffite, a new mineral from Långban. *Geol. Fören. Forh.* **59**, 290-292.

ERRATA

A corrected calculation of laumontite (Leonhardite and Laumontite in Diabase from Dillsburg, Pennsylvania, Lapham, 1963, *Am. Mineral.* **48**, 683-689) based on 60 cations for 64 oxygens should read:

H_2O If calculated on the basis of 28 total cations, the formula is:

H_2O If calculated on the basis of 48 oxygens with no charge imbalance, the formula is:

H_2O

Formula 1) treated H^+ as a cation site and is probably incorrect.

Formula 2) implies a charge imbalance and tetrahedral deficiency.

Formula 3) based on charge balance is preferred. The author is grateful to Douglas Coombs for correcting the original calculation to formula 3).
