

PENDLETONITE: A CORRECTION

JOSEPH MURDOCH AND THEODORE A. GEISSMAN, *University of California, Los Angeles, California.*

In our description of pendletonite (Murdoch and Geissman, 1967), the following errata, which were brought to our attention by Professor J. D. H. Donnay, should be noted.

In the Abstract

Line 4 up: *instead of*  $2V_{z96^\circ}$  to  $115^\circ$ , *read*  $2V_{z65^\circ}$  (red)– $84^\circ$  (violet).

Line 4 up: *instead of*  $Z \wedge c = 21^\circ$ , *read*  $Z \wedge c = +21^\circ$

Line 2 up: *instead of*  $c = 10.42 \text{ \AA}$ , *read*  $c = 10.12 \text{ \AA}$

Line 1 up: *instead of* 9.44, 7.34, 3.46, *read* 9.50, 7.43, 3.49

Line 1 up: *instead of*  $P2/c$ , *read*  $P2/a$

Under Crystallography

Figure 2 was erroneously drawn and indexed. A correct figure is substituted for it (see New Fig. 2).

FIG. 2 (corrected). Left termination typical crystal.

## Under Physical and Optical Properties

P. 614, line 9: *instead of*  $2V_y = 96-115^\circ$ , *read*  $2V_\gamma = 65^\circ$  (red)- $84^\circ$  (violet)

P. 614, lines 9-10: *after*  $Z \wedge c = 21^\circ$ , *add* in the obtuse  $\beta$  angle

## Under X-Ray Study

P. 615, lines 3-4 of text: *instead of*  $C_2h^A$ ,  $P2/c$  *read*  $C_{2h}^A - P2/a$

## Under References

P. 616, line 3 up: *instead of* *crystallographique*, *read* *cristallographique*.

P. 616, line 2 up: *instead of* *Soc. Chem. Belgique*, *read* *Soc. chim. belges*.

THERMAL BEHAVIOR OF  $\text{SiO}_2\text{-X}$  AND ITS RELATION TO THE  
NATURAL SILICA MINERALS: A CORRECTION

ROBERT GREENWOOD, *Department of Geological Sciences,*  
*University of Maine, Orono, Maine.*

The author (Greenwood, 1967) mistakenly attributed ideas about the ordering of  $\text{SiO}_2$  sheets to W. Eitel. As Eitel himself recognizes in the article cited, these ideas originated with O. W. Florke (1955).

Regarding the "disordered" phase of  $\text{SiO}_2\text{-X}$  (Greenwood, 1967, p. 1665), I would concur with Prof. Florke, who suggests (private communication) that this apparent disorder may be an effect of extremely small crystallite size.
