

Hilgardite, $\text{Ca}_2[\text{B}_5\text{O}_9]\text{Cl}\cdot\text{H}_2\text{O}$: a piezoelectric zeolite-type pentaborate

SUBRATA GHOSE AND CHE'NG WAN

Department of Geological Sciences, University of Washington
Seattle, Washington 98195

Abstract

Hilgardite, $\text{Ca}_2\text{B}_5\text{O}_9\text{Cl}\cdot\text{H}_2\text{O}$, from Choctow Salt Dome, Iberville Parish, Louisiana, is monoclinic, space group Aa , with unit-cell dimensions $a = 11.438(2)$, $b = 11.318(2)$, $c = 6.318(1)\text{\AA}$, $\beta = 90.06(1)^\circ$, and $Z = 4$. The crystal structure has been determined from three-dimensional Patterson and Fourier syntheses and refined by full-matrix least-square methods to an R -factor of 0.017 based on 1487 reflections, measured on an automatic single-crystal X-ray diffractometer. The absolute configuration and the hydrogen positions have been determined.

The structure of hilgardite is an open three-dimensional borate framework, whose building block is the anhydrous pentaborate polyanion $[\text{B}_5\text{O}_{12}]^{9-}$, consisting of three (BO_4) tetrahedra and two (BO_3) triangles. The average tetrahedral and triangular B-O distances are 1.474 and 1.363\AA respectively. The polyanions form three-tetrahedral-repeat single chains (6.3\AA c axis) by sharing tetrahedral corners with those belonging to adjacent polyanions. Within each chain, corners of two borate tetrahedra point along $+a$ and $+b$ directions, whereas corners of two borate triangles point along $-a$ and $-b$ directions; these corners are shared with four adjacent chains, such that tetrahedral corners of one chain are shared with triangular corners of the other. The resulting framework has ~ 6 and $\sim 5\text{\AA}$ diameter open channels parallel to the a and c axes respectively. The water molecules and the chlorine atoms within the channels form quasi-linear hydrogen-bonded chains parallel to the c axis. Hilgardite may be the precursor of a new family of borate zeolites.

The calcium atoms occur within channels parallel to the a and b axes. The $[\text{Ca}(1)\text{O}_5\text{Cl}(\text{H}_2\text{O})]$ and $[\text{Ca}(2)\text{O}_6\text{Cl}_2]$ coordination polyhedra are slightly distorted pentagonal and hexagonal bipyramids, with average Ca-O distances 2.465 and 2.535\AA, and average Ca-Cl distances 2.817 and 2.905\AA respectively. By sharing opposite Cl corners the Ca(2) polyhedra form linear chains parallel to the a axis, crosslinked into a sheet by the Ca(1) polyhedra sharing polyhedral corners and edges.

Hilgardite is mildly piezoelectric, the strongest electric axis being parallel to the a axis. The piezoelectricity along b is zero or nearly zero, because the borate triangles point alternately along $+b$ and $-b$, whereas along the a axis, all borate triangles point along $-a$. All borate tetrahedra point along $-c$, the c axis presumably being the intermediate piezoelectric axis.

Introduction

The hydrated calcium chloroborate minerals hilgardite and parahilgardite were found in the insoluble residue from a brine well in the Choctow Salt Dome, Iberville Parish, Louisiana, in association with anhydrite, danburite, boracite, dolomite, magnesite, calcite, quartz, sulphur, and other minerals (Hurlbut and Taylor, 1937, 1938; Hurlbut, 1938). Hilgardite occurs as colorless hemimorphic triangular plates. It is monoclinic, crystal class m . The lack of a center of symmetry is clearly indicated by

the morphology, further confirmed by positive tests for piezoelectricity (Hurlbut, 1938). The unit-cell dimensions were determined by Hurlbut and Taylor (1937), who suggested the space group to be Pc or Pm , and the chemical composition as $\text{Ca}_8(\text{B}_6\text{O}_{11})_3\text{Cl}_4\cdot 4\text{H}_2\text{O}$, which implies a close relationship to colemanite, $\text{Ca}_2\text{B}_6\text{O}_{11}\cdot 5\text{H}_2\text{O}$. Braitsch (1959) confirmed the unit-cell dimensions and found the correct space group to be Cc . In addition, he described a new triclinic strontiohilgardite phase, whose unit-cell volume is one-fourth that of hilgardite; on this basis, he suggested the chemical composition of hilgardite and

Hilgardite, $\text{Ca}_2[\text{B}_5\text{O}_9]\text{Cl} \cdot \text{H}_2\text{O}$.
