_refine_special_details  

;  

Refinement of F^2^ against ALL reflections. The weighted R-factor wR and  

goodness of fit S are based on F^2^, conventional R-factors R are based  

on F, with F set to zero for negative F^2^. The threshold expression of  

F^2^ > 2sigma(F^2^) is used only for calculating R-factors(gt) etc. and is  

not relevant to the choice of reflections for refinement. R-factors based  

on F^2^ are statistically about twice as large as those based on F, and R-  

factors based on ALL data will be even larger.

\_geom\_special\_details

:

All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.
