

$\text{Al}_2\text{O}_3$  corundum (IVCT) supplemental figures and data

1) Corundum GRR 1334 from Malacacheta, Brazil

**Supplemental Figure 1.** Photos of a blue sapphire from Malacacheta, Minas Gerais, Brazil, at 23 °C and 1000 °C. The blue color at room-temperature is lost at elevated temperatures but returns when the sample is cooled.

# Evans & Rossman, Supplemental Document

## 2) Corundum GRR 3473-YS-D from Queensland, Australia

**Supplemental Table 2.** Parameters for Gaussian components compatible with IVCT assignments in GRR3473-YS-D Corundum.

|                            | 19 °C Start | 17 °C End | 1000 °C Heat |

## 3) Corundum GRR 2382-B from Yogo Gulch, Judith Basin County, Montana.

**Supplemental Figure 3a.** Initial heating run of GRR2382-B corundum from Yogo Gulch, Montana, presented as 1.000 mm thick. Features at both short and long wavelengths increase during heating from 23 °C to 1000 °C.

**Supplemental Figure 3b.** Initial cooling run of GRR2382-B corundum from Yogo Gulch, Montana, presented as 1.000 mm thick. The increase in intensity during the initial heating run of the absorption features at short and long wavelengths is retained during cooling from 1000 °C to 20 °C.

# Evans & Rossman, Supplemental Document

**Supplemental Table 3.** Gaussian components for selected bands at room temperature, 500 °C, and 1000 °C in GRR2382-B corundum.

## 4) Corundum GRR 3473 from Queensland, Australia

**Supplemental Table 4a.** Selected major and trace element XRF analysis for GRR3473 corundum samples from Queensland, Australia, given in weight percent.

| Sample       | Fe <sub>2</sub> O <sub>3</sub> | TiO <sub>2</sub> | MgO | Cr <sub>2</sub> O <sub>3</sub> | SiO <sub>2</sub> |
|--------------|--------------------------------|------------------|-----|--------------------------------|------------------|
| GRR3473-YS-D | 2.605                          | N/A              | N/A | N/A                            | 0.110            |
| GRR3473-GS-A | 1.282                          | N/A              | N/A | N/A                            | 0.069            |
| GRR3473-BS-A | 1.576                          | 0.154            | N/A | N/A                            | 0.136            |
| GRR3473-BS-B | 1.869                          | 0.175            | N/A | N/A                            | 0.092            |

Many samples from this locality with sample number 3473 were initially screened. The labels “YS”, “GS”, and “BS” were used to distinguish between different sample archetypes.

“YS” designated samples with high Fe content where optical absorption spectra showed evidence of significant Fe<sup>3+</sup> and comparatively low IVCT pair concentrations.

“GS” designated samples where the contribution of IVCT to the optical absorption spectrum was significant but either no Ti was measured, or the presence of Ti was questionable.

“BS” designated samples where IVCT was significant in the optical absorption spectra and the presence of Ti was more definitive based on XRF data.

**Supplemental Table 4b.** Additional Fe/Fe dominant corundum samples used in corroborating heating runs not included in main text.

| Sample        | Mineral  | Locality              | Thickness | Variety                  |
|---------------|----------|-----------------------|-----------|--------------------------|
| GRR 3473-BS-A | Corundum | Queensland, Australia | 1.016 mm  | Fe/Fe IVCT (880 nm)-blue |
| GRR 3473-BS-B | Corundum | Queensland, Australia | 0.683 mm  | Fe/Fe IVCT (880 nm)-blue |

Octahedral  $\text{Cr}^{3+}$  &  $\text{V}^{3+}$  ( $d-d$ ) supplemental figures and data

8) Corundum, variety ruby, GRR 1843 from Myanmar

**Supplemental Figure 8.** The temperature dependence of the E $\perp$ c spectrum of ruby GRR 1843 from Myanmar, dominated by  $\text{Cr}^{3+}$  spin-allowed  $d-d$  bands, presented as 1.00 mm thick.

# Evans & Rossman, Supplemental Document

## 9) Kyanite:Cr<sup>3+</sup> GRR 656 from Transvaal, South Africa

Supplemental Figures 9a, 9b. Variable temperature spectra of chromium-containing kyanite GRR 656 in E|| $\beta$  and E|| $\gamma$ , plotted for 1.00 mm thickness.

10) Spinel:V<sup>3+</sup> GRR 656 from Nam Ya, Myanmar

**Supplemental Figure 10.** Spectrum of V<sup>3+</sup>-dominant spinel GRR 2323 from Myanmar presented as 1.000 mm thick. Spin-allowed band intensities increase at temperature due to vibronic coupling and completely recover when cooled.

## Fe/Ti IVCT supplemental tables

**Supplemental Table 11.** Comparison of ~570-575 nm Fe/Ti IVCT band parameters in 1000 °C sillimanite and room temperature Fe/Ti dominant corundum.

| Sample                     | Sillimanite 2020-D | Corundum 2382-B |
|----------------------------|--------------------|-----------------|
| Temperature                | 1000 °C Heat       | 24 °C Start     |
| Center (cm <sup>-1</sup> ) | 17492              | 17401           |
| Center (nm)                | 571.69             | 574.67          |
| Linear intensity           | 0.3271             | 0.2867          |
| Integral intensity         | 1910               | 1648            |
| FWHM (cm <sup>-1</sup> )   | 5483               | 5400            |

**Supplemental Table 12.** Comparison of Fe/Ti IVCT band parameters in Fe/Fe dominant corundum at room and moderate heating temperatures to Fe/Ti dominant corundum at room temperature.

| Sample                     | Fe/Fe Corundum<br>(GRR3473-GS-A) |             | Fe/Ti Corundum<br>(GRR2382-B) |
|----------------------------|----------------------------------|-------------|-------------------------------|
| Temperature                | 23 °C Start                      | 500 °C Heat | 24 °C Start                   |
| Center (cm <sup>-1</sup> ) | 18232                            | 17941       | 17401                         |

## Sample Supplemental Documentation

Prior to conducting heating runs, decomposition temperatures at standard pressure (1 atm) were investigated for all mineral types used in this study; literature values were all found to be above 1000 °C, so this temperature was applied as a common upper limit across all samples.

It is also possible for inclusions or minor co-occurring mineral phases to be altered at high temperatures. Among tested samples, sillimanite was the main one where such effects may have been relevant. Sillimanite samples from the GRR2020 catalog number occur with a dull yellow-orange mineral phase. After heating the specific sample that was used in this study, parts of the sample turned a dark brown to black color. Rossman et al (1982) previously noted inclusions with a similar description in sillimanite samples: they find that brown sillimanite contains “acicular inclusions of opaque or dark brown material, presumably an Fe or Fe – Ti oxide.” Despite the observed visual change in the sample, limited to no change occurs in its room temperature absorption spectrum.

In minerals, rapid heating and cooling can cause physical damage such as cracking. The two minute delays at every 100 °C interval in heating and cooling were primarily implemented to allow more than adequate time for thermal equilibration to each new measurement temperature, as discussed in the experimental section. These delays were likely also helpful in reducing the effects of thermal shock. In general, limited to no observable physical damage occurred. Corundum has been observed previously to be highly resistant to fracturing induced by thermal shock during heat treatment (Emmett and Douthit 1993). Some changes were noted in the GRR285 kyanite sample: minor black discoloration occurred along the edges of the sample where it had been cut to fit the dimensions required by the temperature stage.

## Corundum

### *GRR1843 Corundum*

Variety ruby. Purchased in Chanthaburi, Thailand, but likely originally sourced from Myanmar. The coloration is due to its  $\text{Cr}^{3+}$  content.

### *GRR2382 Corundum*

*Left to right: Sample B used in heating runs;*

*unprepared sample from this catalog number.*

Variety sapphire. From Yogo Gulch in Judith Basin County, Montana, USA. This catalog number contains numerous 5 to 8 mm crystals.

The coloration of samples taken from the Yogo Gulch, MT locality is highly uniform. Samples with significant  $\text{Cr}^{3+}$  content will have a light purple tint; this is not the case for Sample B, which is a clear blue. The black sections on the sample are from a different mineral phase that occurs with the corundum.

## *GRR3473 Corundum*

Variety sapphire. From Queensland, Australia. This catalog number contains several small pebbles.

Corundum taken from this locality has relatively high iron content. Many samples with this catalog number are fairly turbid; their colors vary substantially from yellow to green to blue to black.  $\text{Fe}^{3+}$  content is the primary cause of color in yellow to yellow-green samples; IVCT is more significant in samples that display shades of blue.

The samples used that contain blue sections from IVCT are all zoned; cation diffusion during heating had a minor smearing effect on colors between zones for the GS-A, BS-A and BS-B samples.

## YS-D

Bright yellowish green  $\text{Fe}^{3+}$  dominant corundum. Thin, dark brown stripes can be seen running through the sample. These are likely rutile ( $\text{TiO}_2$ ) inclusions: fine needles have been observed previously in natural corundum samples with high Fe content from other localities (Emmett and Douthit 1991).

## GS-A

Zoned IVCT sample containing sections of light blue and of pale yellow to yellow-green. One corner of the sample bears a small orange-brown inclusion.

## Evans & Rossman, Supplemental Document

*(same sample, photographed under different lighting conditions)*

### **BS-A**

Highly turbid and non-uniform IVCT sample. Colors are a mix of a bright blue and a brownish yellow-green. The relative visibility of the different colors varies depending on lighting.

### **BS-B**

Compared to the GS-A and BS-A samples, Sample BS-B was the darkest sample before being thinned during the preparation process for optical absorption studies. Zoned IVCT sample with blue sections in a hazy sea of brownish yellow-green.

## $\text{Al}_2\text{SiO}_5$ polymorphs

### *GRR375 Andalusite*

From Tenderfoot Mountain near Custer, Custer Co, South Dakota, USA.

The sample is highly non-uniform with numerous darker and lighter brown sections.

### *GRR285 Kyanite*

From Minas Gerais, Brazil.

Small piece cut from a larger cleavage slab. Strongly zoned. A blue streak runs through the center of the crystal; the blue color is due to IVCT.

## *GRR656 Kyanite*

From Mashishimala Hills, Letaba District, Transvaal, South Africa.

Bright blue kyanite, occurring with fuchsite. The blue here is primarily due to  $\text{Cr}^{3+}$  content rather than IVCT.

## *GRR2020 Sillimanite*

From Mogok, Myanmar.

Though described as a blue fibrolite, most samples from this catalog number appear nearly colorless with at most a faint gray-blue tint. The dark brown to black sections in the photo above appear after heating.

## Spinel

### *GRR2085 Spinel*

From Mogok, Myanmar.

This catalog number contains assorted colors of spinel with a variety of chemical compositions in a jar of tumbled gem gravel. The  $\text{Fe}^{2+}$  spinel sample pictured here is a light purple color and contains reddish brown inclusions

### *GRR2323 Spinel*

From Namyazeik, Kachin State, Myanmar.

This catalog number corresponds to a box of pebbles, mostly spinel. The sample pictured here is a  $\text{V}^{3+}$  dominant spinel sample, though its  $\text{Cr}^{3+}$  content also contributes to the color – a pink to reddish pink.
